

AI ASSISTED CODING – 8.3

NAME : S.NADHIYA

ROLL NO : 2403A510C6

BATCH : 05

DEPT : CSE

Task – 01

Prompt:

Write a python code for valid email id where the it must contain @ and (.) character ,should not end with special characters , and should not contain multiple @.

Code generated:

```
python.py X
python.py > ...
1  def is_valid_email(email):
2      """
3      Validates an email address based on the following criteria:
4      - Must contain @ character
5      - Must contain . character
6      - Should not end with special characters
7      - Should not contain multiple @ characters
8      """
9
10     # Check if email is empty or None
11     if not email:
12         return False
13
14     # Check if email contains @ character
15     if '@' not in email:
16         return False
17

=====
Interactive Email Validation
=====
Enter an email to validate (or 'quit' to exit): nadhiya
✗ 'nadhiya' is NOT a valid email address!

Enter an email to validate (or 'quit' to exit): nadhiya@gmail.com
✓ 'nadhiya@gmail.com' is a valid email address!

Enter an email to validate (or 'quit' to exit): exit
✗ 'exit' is NOT a valid email address!

Enter an email to validate (or 'quit' to exit):
```

Observation:

1. ****Simple Logic Flow****: The function uses straightforward if-statements to check each requirement sequentially, making it easy to understand and debug.
2. ****No External Dependencies****: The code uses only built-in Python functions (`count()`, `in`, `not`) without any imports, keeping it lightweight and portable.
3. ****Comprehensive Test Coverage****: The test function includes both valid and invalid email examples covering all validation rules, making it easy to verify the function works correctly.

Task – 02

Prompt:

write a python code to test cases for assigning grades) where: 90-100: A, 80-89: B, 70-79: C, 60-69: D, <60: F

- Include boundary values and invalid inputs (e.g., -5, 105, "eighty").

Code generated:

```
python.py > ...
1 def assign_grade(score):
2     """Assign grade based on score: 90-100: A, 80-89: B, 70-79: C, 60-69: D, <60: F"""

=====
Test Results: 20/20 tests passed
PS C:\Users\nadhi\OneDrive\Desktop\AID>
```

Observation:

The code effectively tests all boundary conditions (90, 89, 80, 79, etc.) and invalid inputs (negative numbers, over 100, non-numeric strings) with clear pass/fail reporting, making it a comprehensive test suite for grade assignment logic.

The formatting improvements you made (using `!r` for `repr()` and adjusting column widths) enhance readability by properly displaying string inputs with quotes and aligning the output columns better for visual clarity.

Task -03

Prompt:

write a python code for a sentence palindrome where test cases for `is_sentence_palindrome(sentence)` (ignores case, spaces, and punctuation).

- Example:

"A man a plan a canal Panama" → True.

Code generated:

```
python.py X
python.py > ...
1 import re
2
3 def is_sentence_palindrome(sentence):
4     """
5     Check if a sentence is a palindrome, ignoring case, spaces, and punctuation.
6
7     Args:
8         sentence (str): The sentence to check
9
10    Returns:
11        bool: True if the sentence is a palindrome, False otherwise
12    """
13    # Remove all non-alphabetic characters and convert to lowercase
14    cleaned = re.sub(r'[^\a-zA-Z]', '', sentence.lower())
15
16    # Check if the cleaned string is equal to its reverse
17    return cleaned == cleaned[::-1]
18
19 def test_is_sentence_palindrome():
20     """Test cases for is_sentence_palindrome function"""
21
22     # Test case 1: Classic palindrome
23     assert is_sentence_palindrome("A man a plan a canal Panama") == True
24
25     # Test case 2: Simple palindrome
26     assert is_sentence_palindrome("racecar") == True
27
28     # Test case 3: Palindrome with punctuation
29     assert is_sentence_palindrome("Was it a car or a cat I saw?") == True
30
31     # Test case 4: Not a palindrome
32     assert is_sentence_palindrome("Hello world") == False
33
34     # Test case 5: Empty string
35     assert is_sentence_palindrome("") == True
36
37     # Test case 6: Single character
38     assert is_sentence_palindrome("a") == True
39
40     # Test case 7: Palindrome with numbers and special characters
41     assert is_sentence_palindrome("A1B2C3C2B1A") == True
42
43     # Test case 8: Case insensitive test
44     assert is_sentence_palindrome("Madam") == True
```

```
python.py > ...
19 def test_is_sentence_palindrome():
20     assert is_sentence_palindrome("A man a plan a canal Panama") == True
21
22     # Test case 2: Simple palindrome
23     assert is_sentence_palindrome("racecar") == True
24
25     # Test case 3: Palindrome with punctuation
26     assert is_sentence_palindrome("Was it a car or a cat I saw?") == True
27
28     # Test case 4: Not a palindrome
29     assert is_sentence_palindrome("Hello world") == False
30
31     # Test case 5: Empty string
32     assert is_sentence_palindrome("") == True
33
34     # Test case 6: Single character
35     assert is_sentence_palindrome("a") == True
36
37     # Test case 7: Palindrome with numbers and special characters
38     assert is_sentence_palindrome("A1B2C3C2B1A") == True
39
40     # Test case 8: Case insensitive test
41     assert is_sentence_palindrome("Madam") == True
42
43     # Test case 9: Complex palindrome with mixed punctuation
44     assert is_sentence_palindrome("A Santa at NASA!") == True
45
46     # Test case 10: Non-palindrome with similar characters
47     assert is_sentence_palindrome("Palindrome") == False
48
49     print("All test cases passed!")
50
51 if __name__ == "__main__":
52     # Run the test cases
53     test_is_sentence_palindrome()
54
55     # Example usage
56     test_sentence = "A man a plan a canal Panama"
57     result = is_sentence_palindrome(test_sentence)
58     print(f"'{test_sentence}' is a palindrome: {result}")
```

Output:

```
Score: 55 | Expected: 'F' | Got: 'F' | PASS
=====
Test Results: 20/20 tests passed
PS C:\Users\nadhi\OneDrive\Desktop\AI> & C:\Users\nadhi\anaconda3\python.exe c:\Users\nadhi\OneDrive\Desktop\AI\python.py
All test cases passed!
'A man a plan a canal Panama' is a palindrome: True
PS C:\Users\nadhi\OneDrive\Desktop\AI> []
```

Observation:

1. **Efficient cleaning approach:** The regex `re.sub(r'^a-zA-Z', '', sentence.lower())` removes all non-alphabetic characters in one operation, making it more efficient than multiple string operations.
2. **Pythonic palindrome check:** Using `cleaned == cleaned[::-1]` leverages Python's slice notation to reverse the string, which is both readable and performant compared

Task – 04

Prompt:

write a python code to nerate test cases for a ShoppingCart class
(add_item,remove_item, total) where code should contain
Add_item(name,orice),Remove_item(name),total_cost().

Code generated:

```
python.py > ...
class ShoppingCart:

Date Format Converter
Convert from YYYY-MM-DD to DD-MM-YYYY
=====
Testing convert_date_format function:
=====
Test 1: 2023-10-15 → 15-10-2023 [✓ PASS]
Test 2: 2024-01-01 → 01-01-2024 [✓ PASS]
Test 3: 2023-12-31 → 31-12-2023 [✓ PASS]
Test 4: 2024-02-29 → 29-02-2024 [✓ PASS]
Test 5: 2023-06-05 → 05-06-2023 [✓ PASS]
Test 6: invalid-date → Error: Invalid date format [✓ PASS]
Test 7: 2023-13-01 → 01-13-2023 [X FAIL]
Expected: Error: Invalid date format
Test 8: 2023-01-32 → 32-01-2023 [X FAIL]
Expected: Error: Invalid date format
=====
User Input Testing:

Enter a date (YYYY-MM-DD) or 'quit' to exit: 2015-01-22
Converted: 22-01-2015

Enter a date (YYYY-MM-DD) or 'quit' to exit: 2023-03-12
Converted: 12-03-2023

Enter a date (YYYY-MM-DD) or 'quit' to exit: exit
Converted: Error: Invalid date format

Enter a date (YYYY-MM-DD) or 'quit' to exit: █
```

Observation:

The code successfully converts dates from **YYYY-MM-DD** to **DD-MM-YYYY** format and includes both automated test cases and interactive user input.

However, it only checks string structure, not actual calendar validity (e.g., invalid months/days may pass if formatted correctly).
